History's Most Influential Women

Throughout history, women have struggled to be taken seriously, have their work accepted, and be considered the equal of men. This book celebrates women such as Cleopatra, Joan of Arc, Sojourner Truth, and Princess Diana, who have all left an indelible mark on history. Readers will gain new insight into one hundred world-changing contributors who should be celebrated and never marginalized or forgotten.

- Historic figures are presented in chronological order
- Serves as the perfect guide for high school research projects
- Covers a range of women from different world backgrounds

NEW SPRING 2024!

The Right Career for Me

The books in this informative set provide in-depth examinations of familiar, high-demand jobs that teens are curious about. What kind of training and education will I need to become a carpenter? What salary can I expect to make as a physical therapist? Will I need to go to school to become a hairstylist? Young readers in search of career options will find the answers to these and many other questions. These books examine careers that are in high demand during times when the economy is doing well, and when it's not. Each guide explores necessary job skills, educational requirements, training programs, the future outlook of each career, and other crucial information. Informative sidebars focus on real-life issues and provide additional advice for teens.

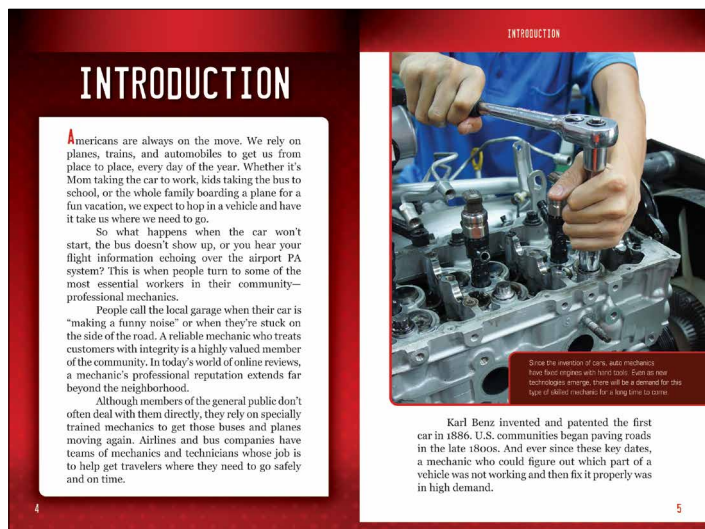

- Sidebars focus on famous individuals, as well as interviews with people in the highlighted career
- Texts offer a historical perspective of each profession and show how they remained essential over the years
- Further information sections provide readers with valuable career resources

To Restore Biodiversity, Embrace Biotech's 'Intended Consequences'

By Paul Robbins, Ryan Pheasant

In December of 2020, when scientists managed the incredible feat of cloning the endangered black-footed ferret, they took a leap toward the renewed global priority to combat climate change and biodiversity loss. The cloning success both fulfilled the founding vision of Earth Day and frightened its strongest proponents. By using biotechnology to achieve one of conservation's most critical goals—to restore genetic diversity to a species faced with a limited gene pool—conservationists made a step forward in saving a beloved species. But they did so by “inbreeding” with the core mechanisms of life itself. This effort realized the vision of Earth Day founder and Nelson Institute namesake Gaylord Nelson, to foster “an environment of decency, quality and mutual respect for all other human beings and all other living creatures.” Would Nelson have recognized and valued this advance? We believe so. To restore biodiversity, we will have to innovate.

While none of this obviates the need for traditional conservation measures, like habitat protection and land management, we can and we should address the looming extinction crisis with the same bold and rapid approach used to fight COVID-19. A creative ethos and an open mind can release the power of new technologies.

Together, we have years of conservation experience. One of us is an environmental researcher and the other the co-founder and executive director of Revive & Restore. We understand the importance of supporting and restoring biodiversity, and we are teaming up with the world's leading molecular biologists, technologists, conservation biologists, conservation organizations, ethicists and thought leaders to call for “Intended Consequences” to help us safely use all of the available tools that can provide the advantage we need to turn the tide on species loss.

Intended Consequences is a new, inclusive, ethical and rational framework that will help us envision bold conservation interventions and safely leverage biotechnology to win the race against extinction.

Some individuals worry about the *unintended* consequences of intervening with nature, including the use of genetic technology as well as traditional conservation restoration. However, alarming biodiversity loss tells us we must be more focused on the game-changing positive impacts that will result from a focus on Intended Consequences. If we fret endlessly about unintended consequences and wallow in uncertainty, we will inevitably witness the chilling result as a mass extinction plays out. Our current pivot point asks of us boldness and action as we consider biotechnology solutions and weigh the consequences of doing nothing.

The American chestnut, for example, will not survive without intervention. Prior to the industrial revolution, these trees formed endless stands in the Eastern forests of North America. By the 1940s a nonnative fungal blight killed an estimated four billion trees nationwide. As Eastern forests lost the American chestnuts, smaller trees established denser stands. This shift resulted in a new ecological state characterized by impoverished habitats, shrunken wildlife populations, inferior forest products and reduced biodiversity.

Towards the end of the 20th century, a team of innovative scientists began experimenting in the lab. They added a gene from wheat to the otherwise unaltered American chestnut genome. The resulting transgenic tree is no freak of nature. It is a 100 percent American chestnut that now produces an enzyme that degrades the blight's toxin. Because of this single additional gene, it can coexist on landscapes where the invasive fungus also thrives.

This seemingly radical solution is an elegant example of the potential for biotechnology to enable species-saving interventions. American chestnut fans want seedlings to plant in their yards, and the Eastern Band of Cherokee Indians in North Carolina has signed onto plant blight-resistant chestnut trees on tribal land. But this early enthusiasm is only part of the process.
